

# ECSS-10 Software Installation on Ubuntu 18.04 Operating System

# About

## Video codecs

- H.263-1998
- H.264

## Accounting

- CDR
- RADUIS AAA

## Hardware platform

- Installation on productive industrial servers
- Support for installation on virtualization platforms
- Operating systems: Ubuntu 18.04 LTS, AstraLinux

## Management

- 2xWeb-interfaces for management and monitoring (HTTPS)
- MML console
- Subscriber portal

## Signaling

- SIP 2.0 (RFC 3261)
- SIP-T/SIP-I/SIP-Q
- H.248 (MEGACO)
- T.38, SNMP, RADIUS AAA

\* TDM Signaling support (SS7, DSS-1 PRI (Q.931))  
available with additional gateways

# About

## Audio codecs

- G729(A/B)
- L16
- Speex
- G711(A/U)
- G.722
- GSM FR
- G726
- iLBC
- OPUS

## Redundancy

- "Active-Active" redundancy mode
- GEO-Backup support
- Upper-registration support (with SMG gateways)

## Additional features

- SIP-registrar server
- Transcoding media streams
- Support for a wide range of VAS (Value Added Services)
- Hot software update
- Load balancing, trunk lines restrictions
- Black- and Whitelists on trunk line
- Support for geographically distributed media servers

# Content

1. Server preparation steps
2. ECSS-10 software installation in «Active-Active» mode
3. ECSS-10 software installation in «W/o backup» mode
4. Additional software installation
5. Q/A

# Server preparation steps

## System installation

### Preparation

Linux OS installation

Network setup for  
ECSS-10 server/VM

Linux OS upgrade

Additional software  
installation

### Installation

ECSS-10 system  
installation

# Server preparation steps

## Preparation step 1. Ubuntu OS installation

- Install Ubuntu 18.04.0x server OS as required
- Set hostname for server#1 – [ecss1](#), server#2 – [ecss2](#)
- Set any username and password exclude [ssw \(system username\)](#)
- Set up a network for remote work with the OS and Internet access
- Create the necessary disk partitions and LVM group
- Check documentation [docs\\_eltex\\_co\\_ru](#) – Softswitch ECSS-10

# Server preparation steps

## Preparation step 2. Ubuntu OS settings

### **Disable SWAP And set up timezone**

- `sudo swapoff -a`
- `sudo rm /swap.img`
- `sudo timedatectl set-timezone Asia/Novosibirsk`  
(example for city Novosibirsk (Russia))

# Server preparation steps

## Preparation step 2. Ubuntu OS settings

### **Set /etc/hosts for cluster mode**

#### **ecss1:**

- 127.0.0.1 localhost
- 127.0.1.1 ecss1
- 192.168.1.22 ecss2

#### **ecss2:**

- 127.0.0.1 localhost
- 127.0.1.1 ecss2
- 192.168.1.21 ecss1

#### **Example:**

ecss1 has 192.168.1.21,  
ecss2 — 192.168.1.22.

# Server preparation steps

## Preparation step 3. Ubuntu OS network setup

### **It necessary to setup network on both servers**

- For hardware cluster recommended to setup bonding (LACP IEEE 802.3ad)
- Choose necessary network interfaces and VLAN`s
- Use Netplan (Ubuntu 18.04 LTS) for network configuration
- Check Internet access (only for installation period!)
- Check Netplan setting in details on [docs.eltex-co.ru](http://docs.eltex-co.ru) – Softswitch ECSS-10

# Server preparation steps

## Preparation step 4. Ubuntu OS packets setup

### Connect Eltex repository with ECSS-10 Softswitch packets

```
sudo sh -c "echo 'deb [arch=amd64]  
http://archive\_eltex.org/ssw/bionic/3.14\_stable\_main\_extras\_external' > /etc/apt/sources.list.d/eltex-ecss10-stable.list"
```

### And register repository keys

```
sudo apt-key adv --keyserver keyserver.ubuntu.com --recv-keys  
33CB2B750F8BB6A5
```

\*For AstraLinux OS installation other repo addresses in use  
(check the documentation)

# Server preparation steps

## Preparation step 4. Ubuntu OS packets setup

### Upgrade OS

```
sudo apt update  
sudo apt upgrade
```

### Install required service software

```
sudo apt install  
ntp tcpdump vlan dnsmasq
```

# Server preparation steps

## Preparation step 4. Ubuntu OS packets setup

### Install

#### **List of additional software for debugging (optional)**

```
sudo apt install aptitude atop ethtool  
htop iotop mc minicom mtr-tiny nmap  
pptpd pv screen ssh tftpd vim sngrep  
tshark cpanminus gnuplot libgraph-easy-  
perl debconf-utils
```

#### **Software for «Active-Active» mode**

```
sudo apt install  
ifenslave-2.6 keepalived attr
```

#### **Additional software for «Active-Active» mode**

```
sudo apt install  
bridge-utils ethtool
```

# Server preparation steps

## Preparation step 5. Check the OS installation and packet list

**To check installed ecss packages use**

```
dpkg --get-selections | grep ecss
```

\*instead ecss you can use any key-word  
to find any packages

\*no packets installed with empty output  
on display

Check that the first-time installation are occurred!

Some packages should be to remove before you will try  
install ecss again.

For e.g., delete MySQL working directories

```
sudo rm -R /var/lib/mysql/
```

# ECSS-10 software installation in «Active-Active» mode

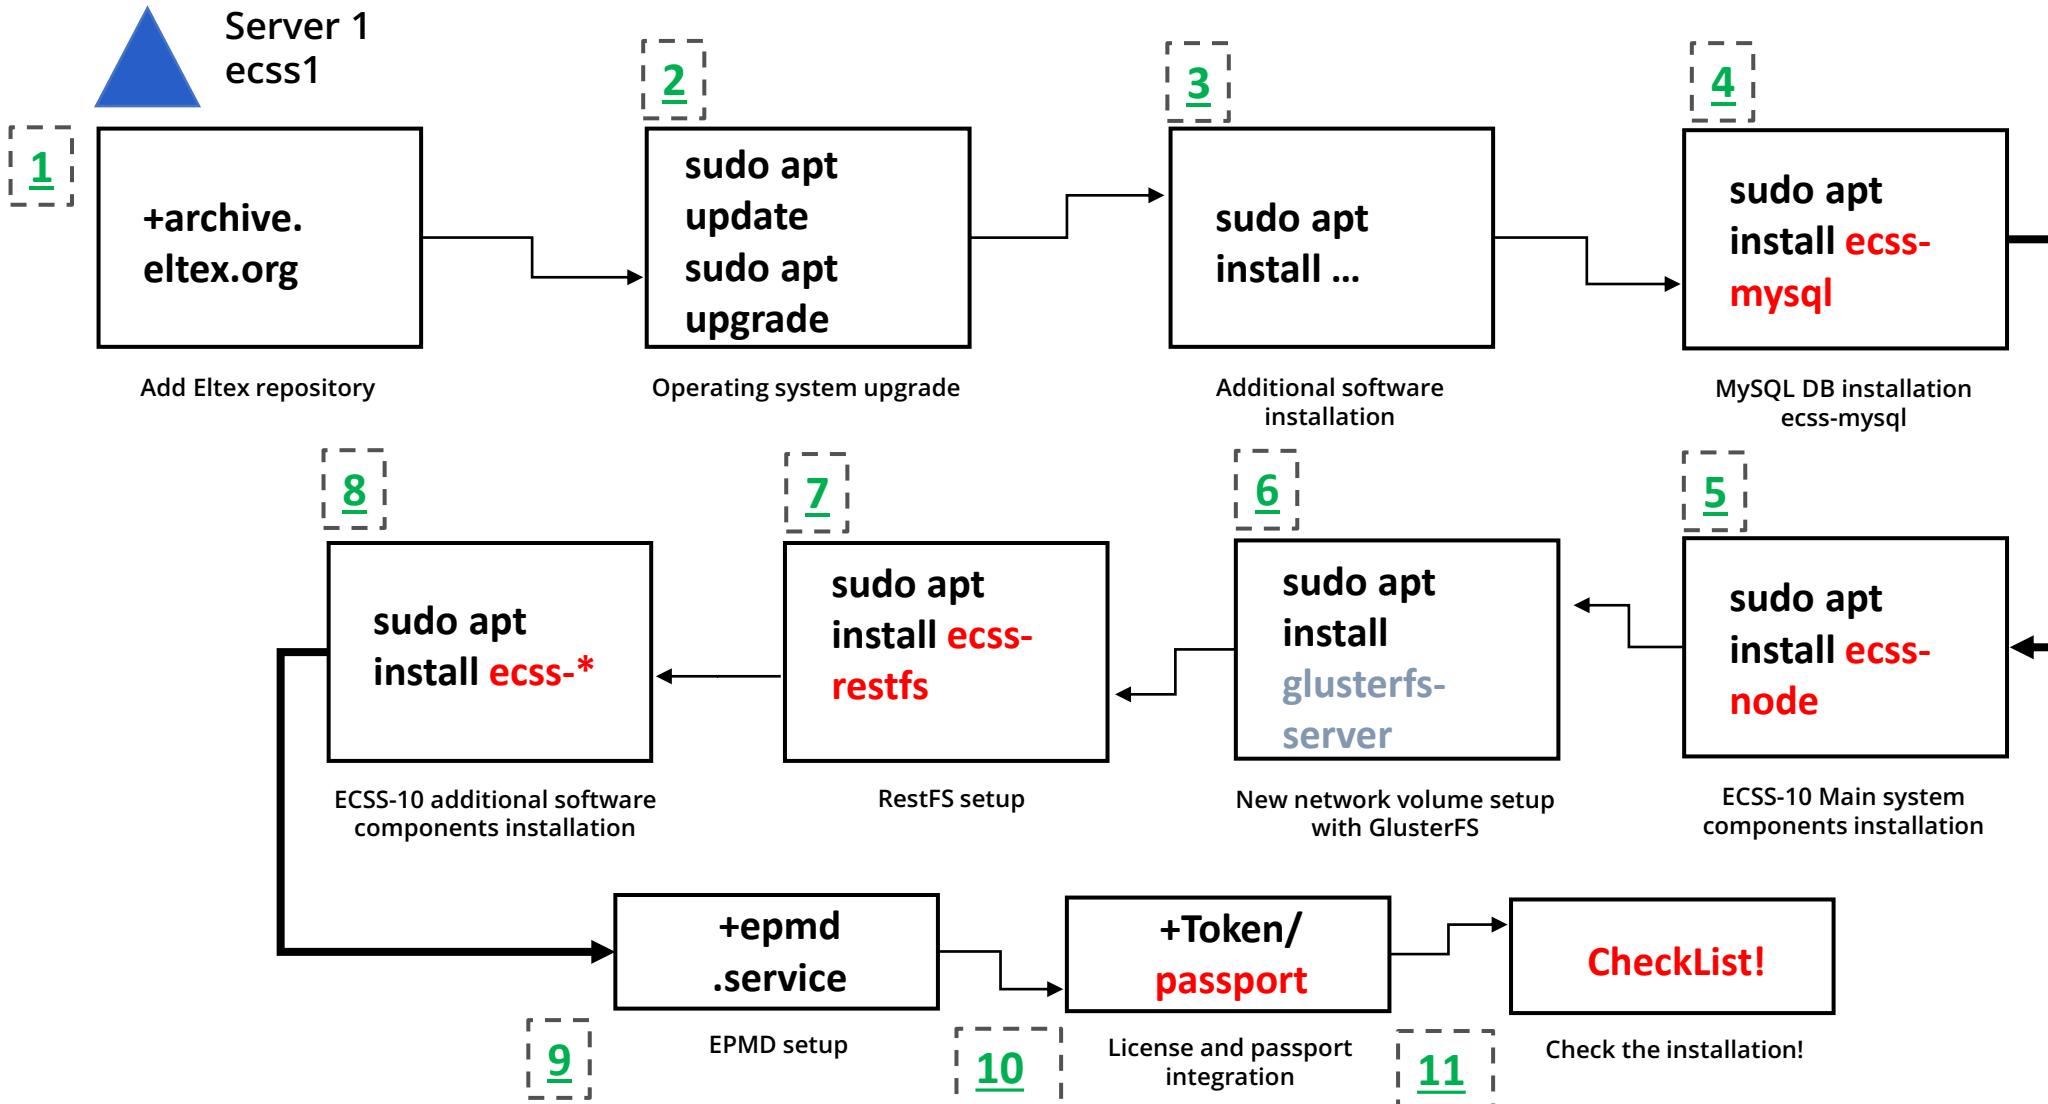

## Installation scheme

### Install ECSS-10 software “Step-by-step” in different distribution schemes

1. Active-Active mode (server 1)
- 1.2 Active-Active mode (server 2)
2. Replication settings SIP and MySQL addresses based on Keepalived and VRRP
3. Example for virtual IP addresses for SIP
4. W/o backup mode settings

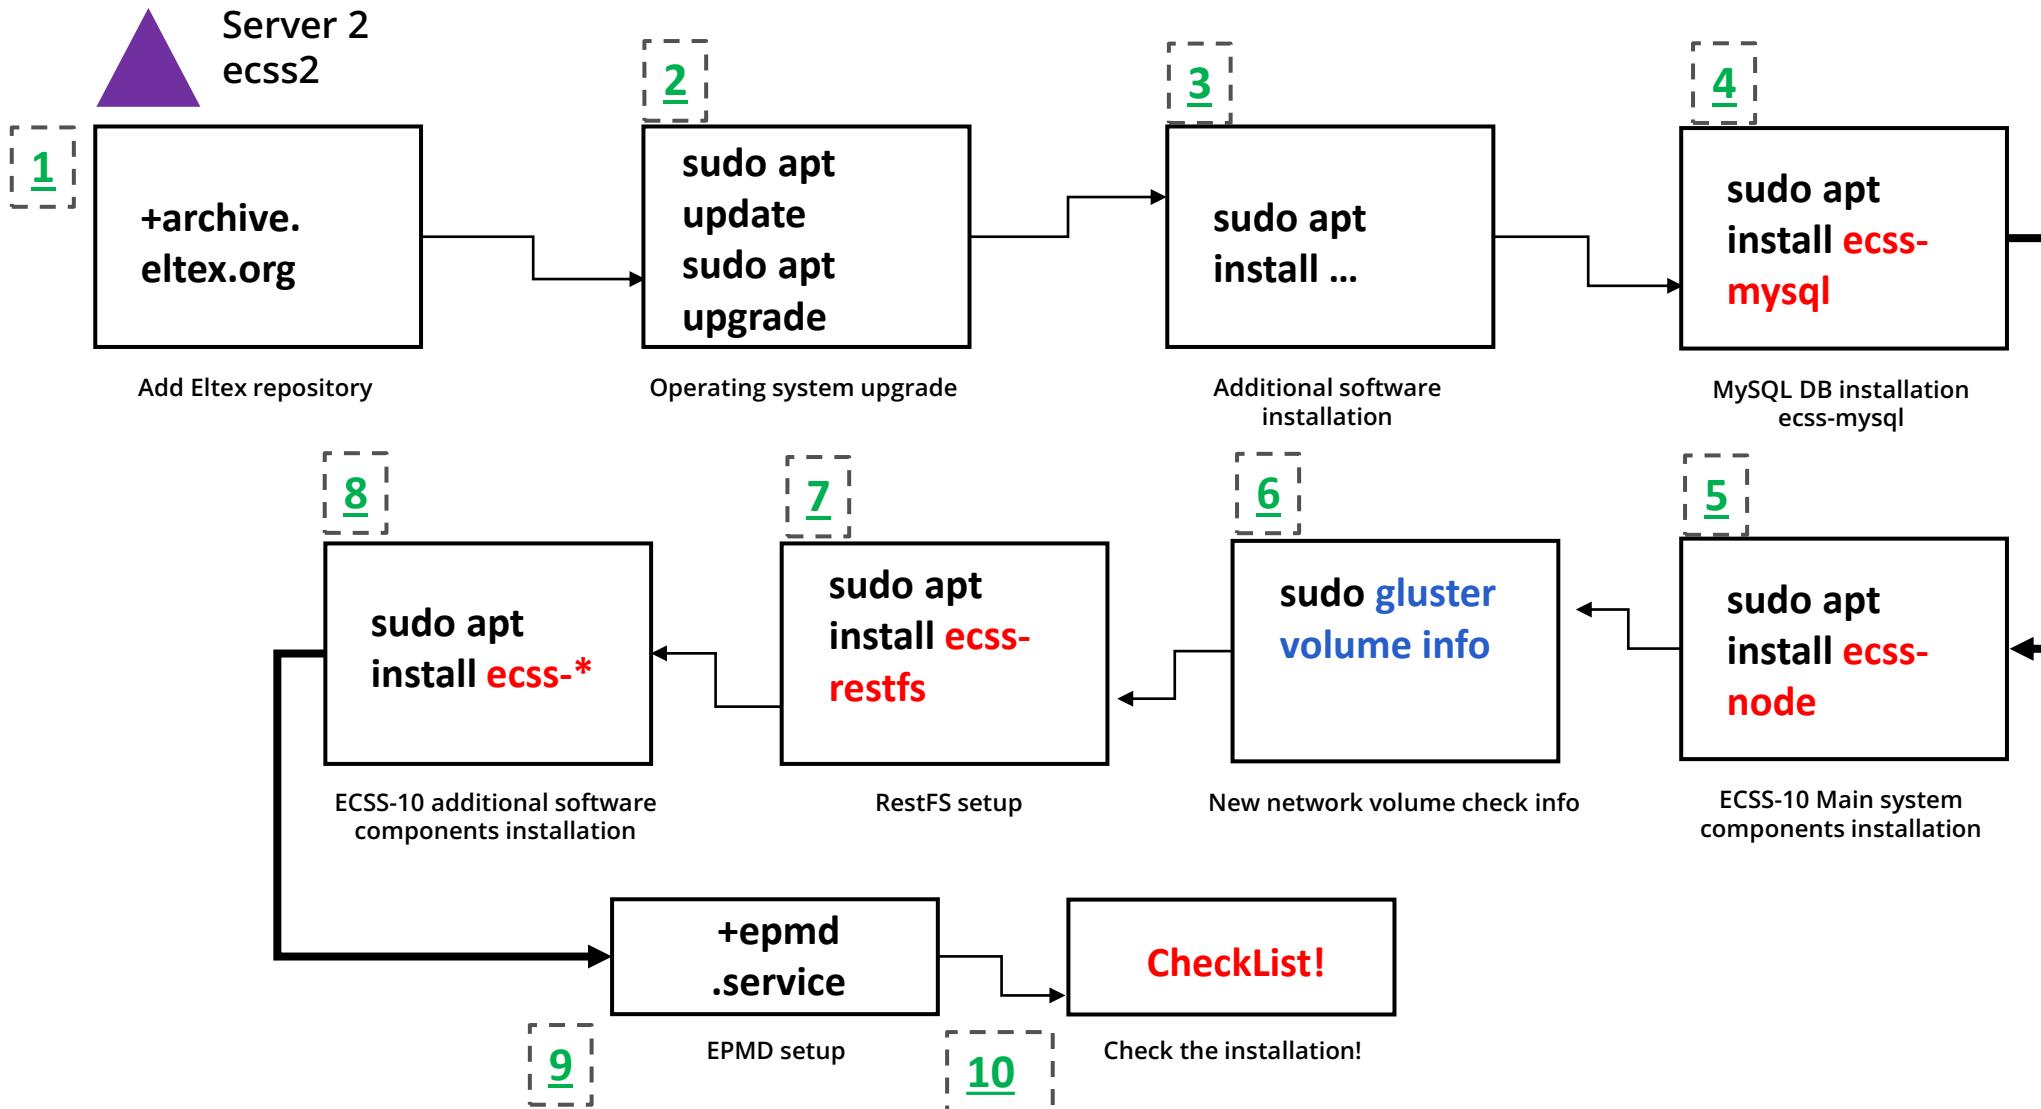

# ECSS-10 software installation in «Active-Active» mode

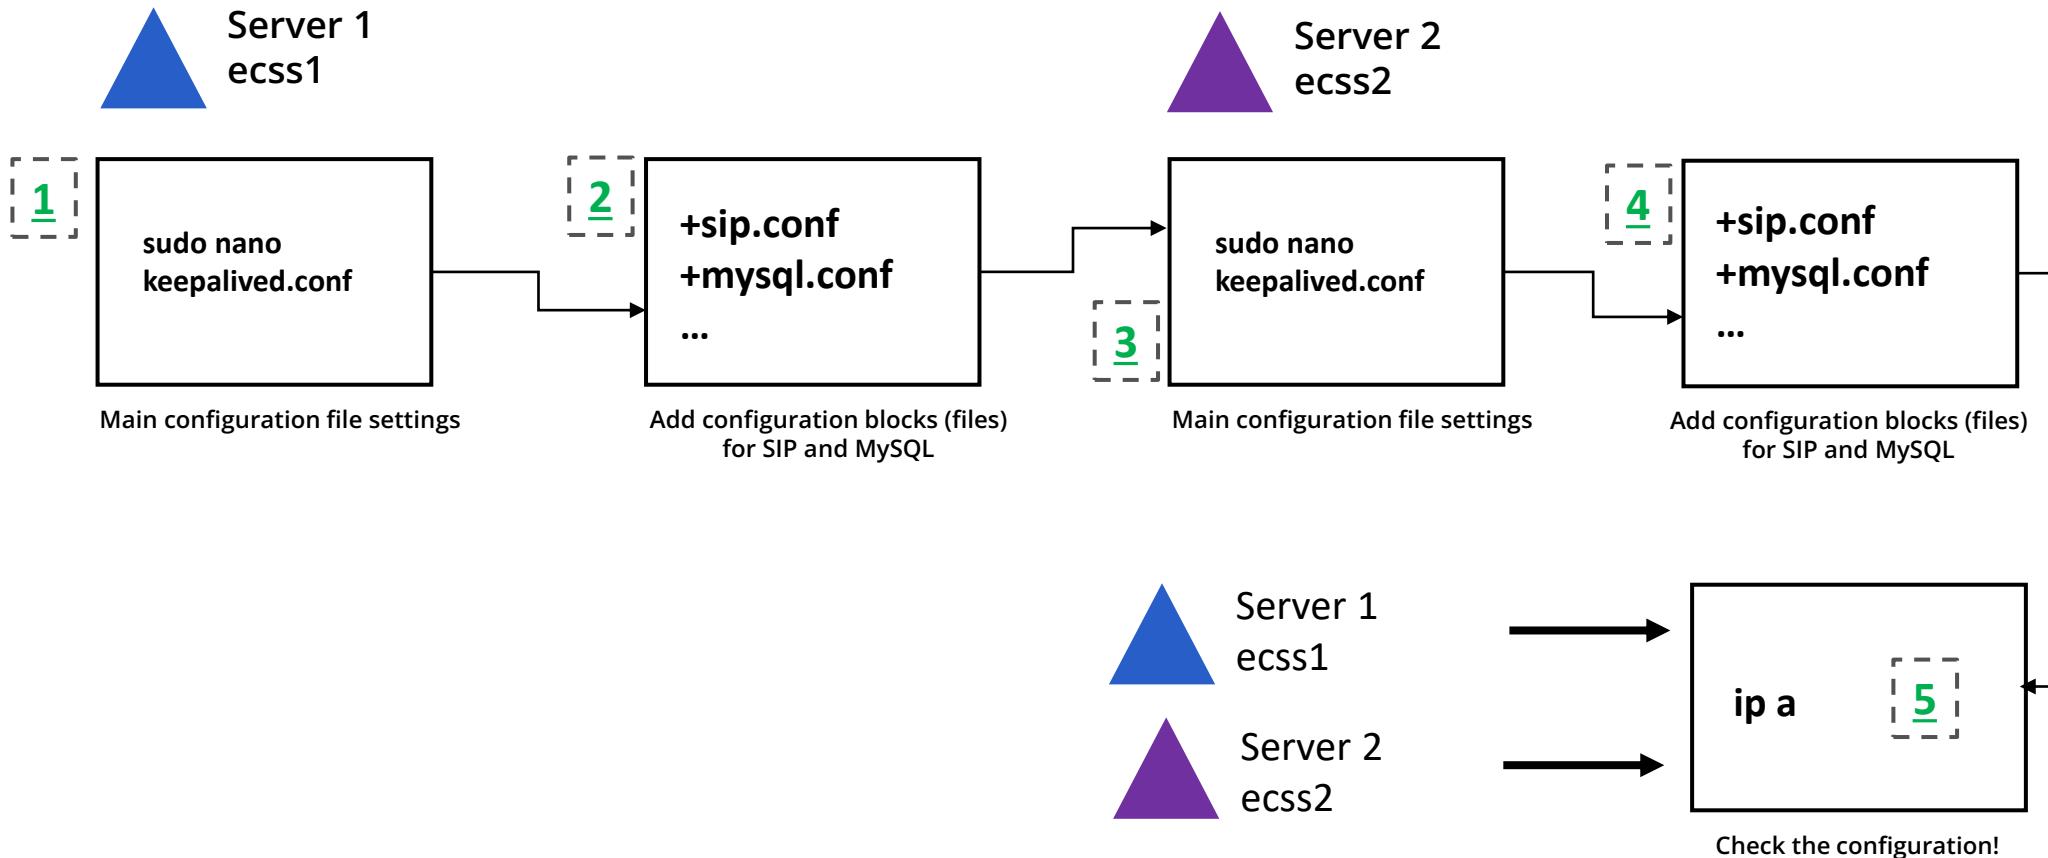

# ECSS-10 software installation in «Active-Active» mode

# ECSS-10 software installation in «Active-Active» mode

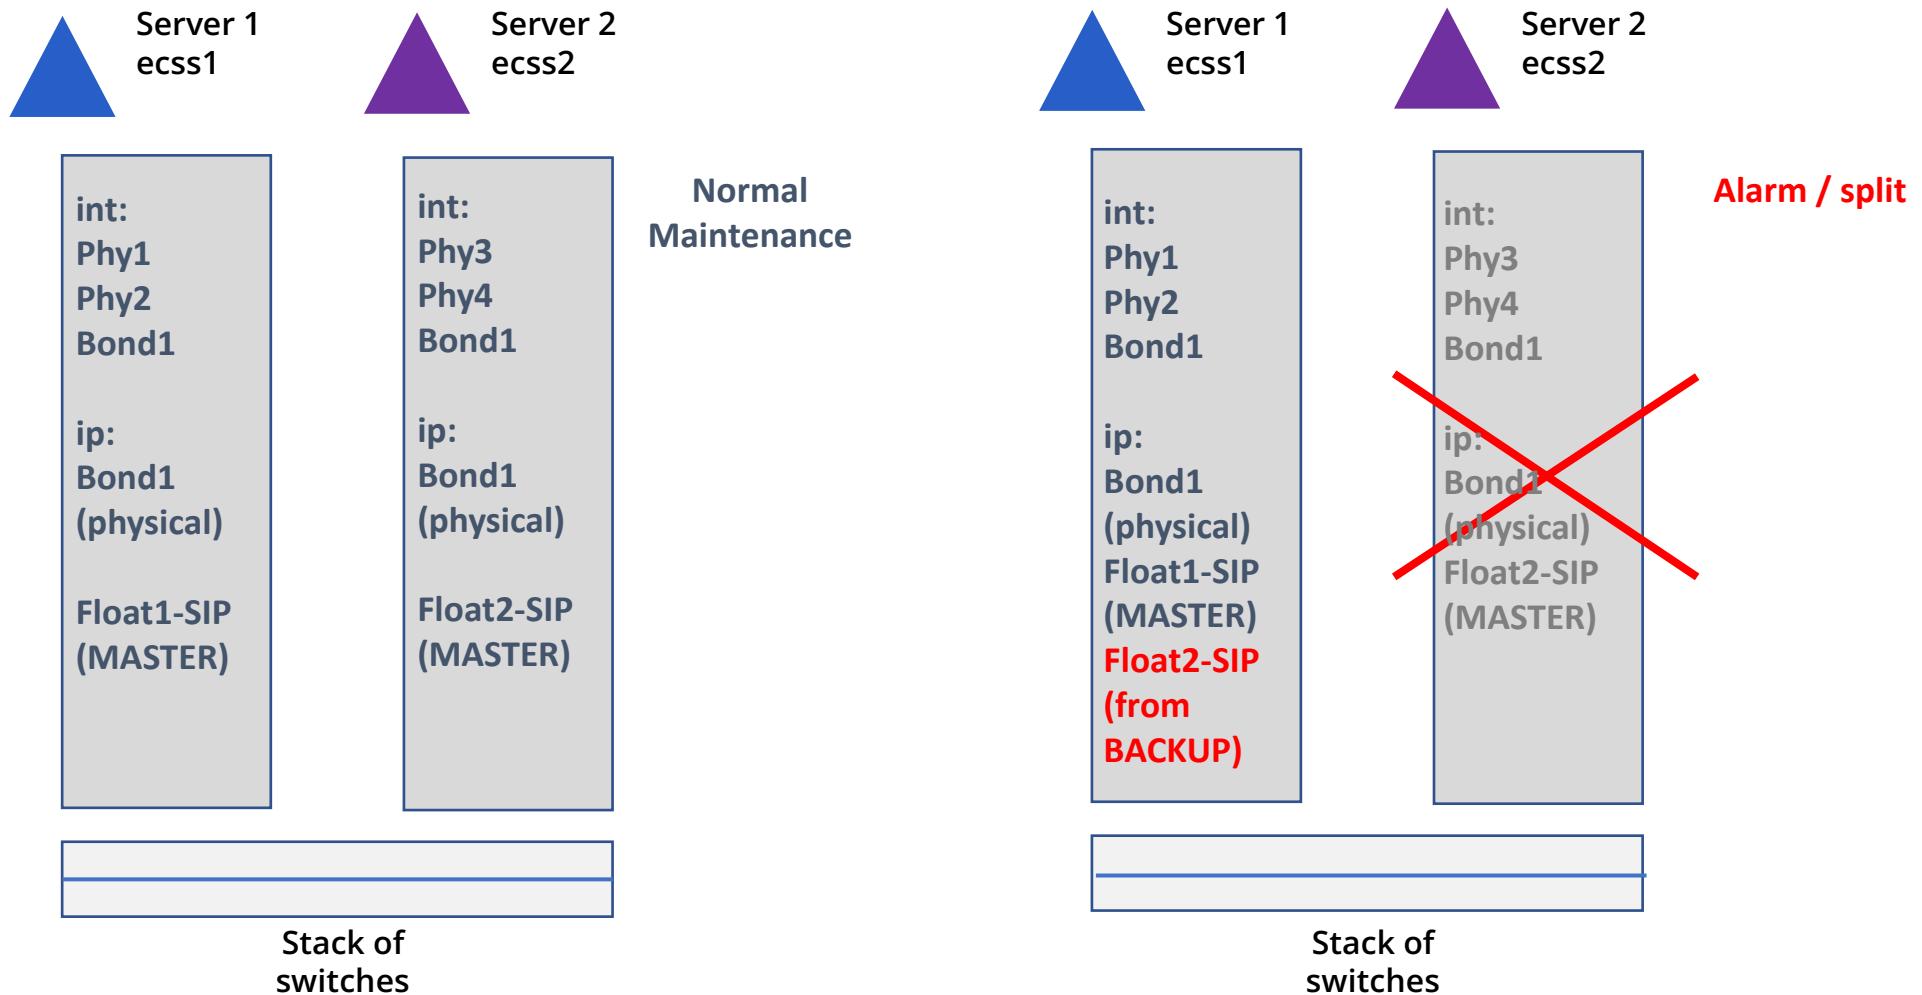

## Replication settings

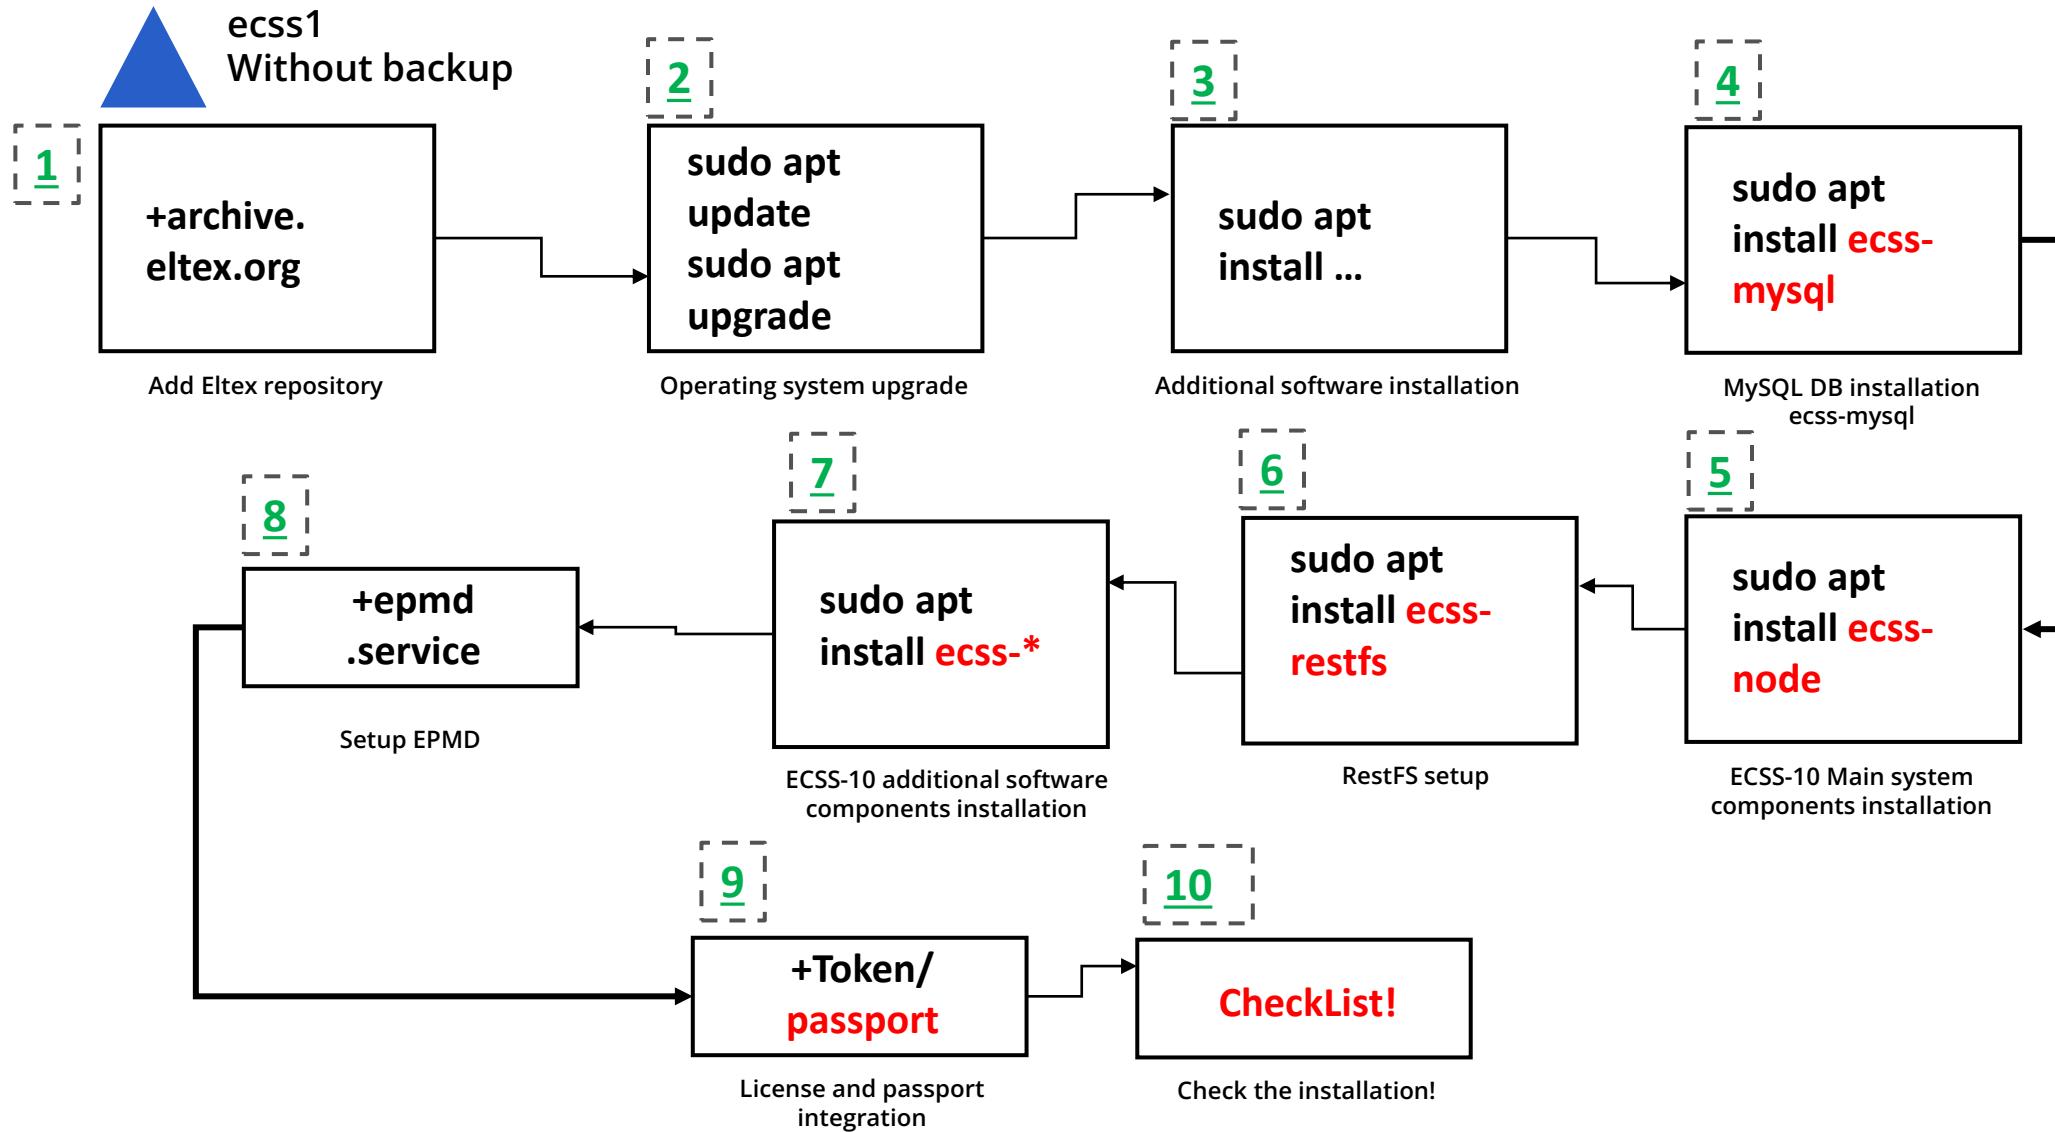

# ECSS-10 software installation in «Active-Active» mode

Replication settings - example

# ECSS-10 software installation in «W/o backup» mode

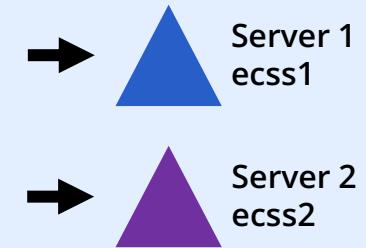

# ECSS-10 software installation in «Active-Active» mode

Step 1

**Installation starts with special data base  
package - ecss-mysql**

`sudo apt install ecss-mysql`

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 1

### List of databases as the result of package installation

```
mysql> SHOW DATABASES;
```

Database
information_schema
ecss_address_book
ecss_audit
ecss_calls_db
ecss_dialer_db
ecss_meeting_db
ecss_numbers_db
ecss_statistics
ecss_subscribers
ecss_system
history_db
mysql
performance_schema
sys
web_conf

# ECSS-10 software installation in «Active-Active» mode

Step 1

Package configuration

```
Configuring ecss-dns-env

Select what are you want to configure:

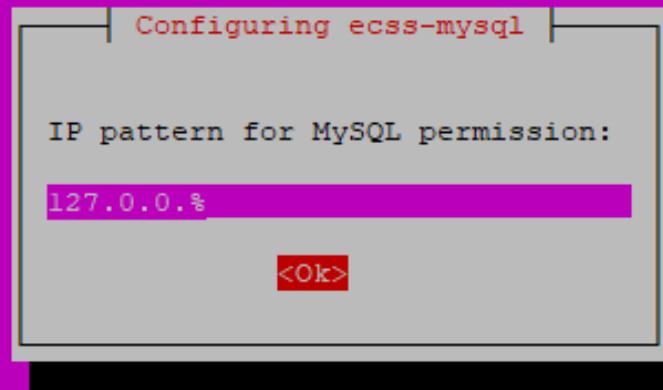

[ ] broker
[ ] ldap
[ ] mysql
[ ] notifier
[ ] restfs
[ ] subscriber-portal
[ ] syslog

<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 1

# ECSS-10 software installation in «Active-Active» mode

Step 1

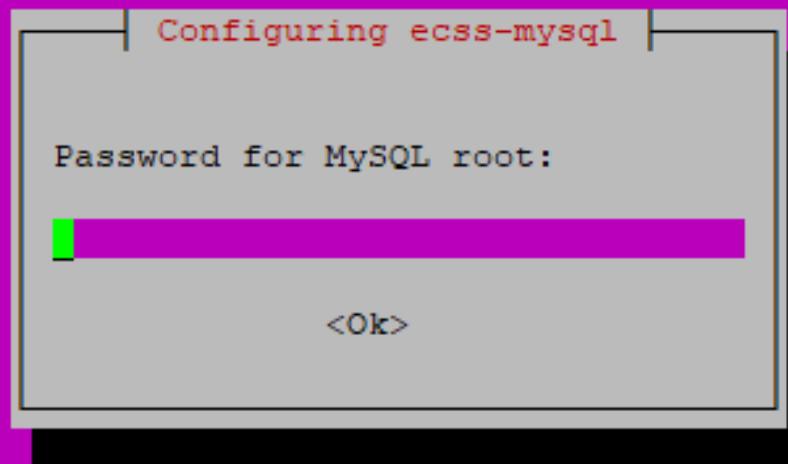

```
Configuring ecss-mysql

Login for MySQL root:
root<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 1

# ECSS-10 software installation in «Active-Active» mode

## Step 1

```
MySQL connection test success
Clear dead links to databases
Deploy MySQL tables
Creating database 'web_conf' ...
Database 'web_conf' is complete
Creating database 'ecss_audit' ...
Database 'ecss_audit' is complete
Creating database 'ecss_meeting_db' ...
Database 'ecss_meeting_db' is complete

[Progress: [ 99%] [#########################################] ]
```

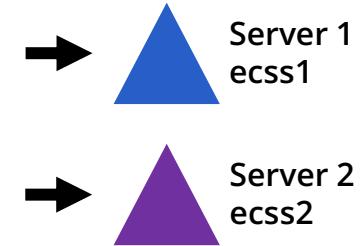

# ECSS-10 software installation in «Active-Active» mode

Step 2

## ECSS-10 Main system components installation

```
sudo apt install ecss-node
```

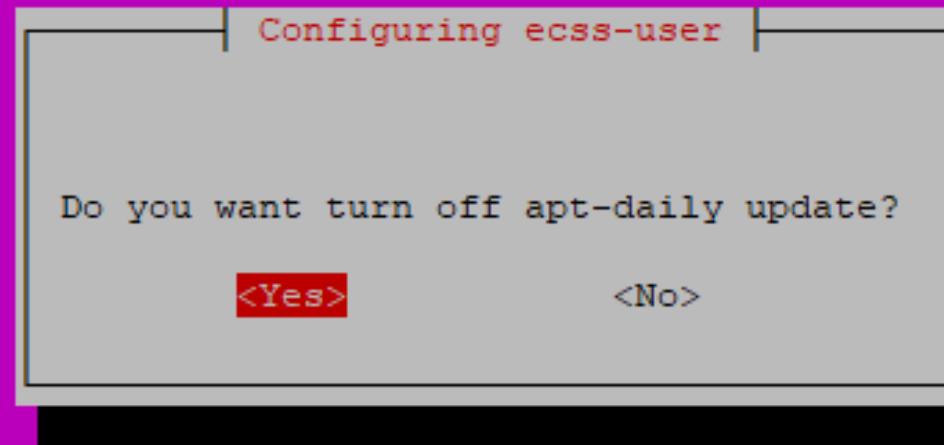

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

## Certificates installation

```
sudo apt install ecss-node
```

Execute to:

→  Server 1  
ecss1

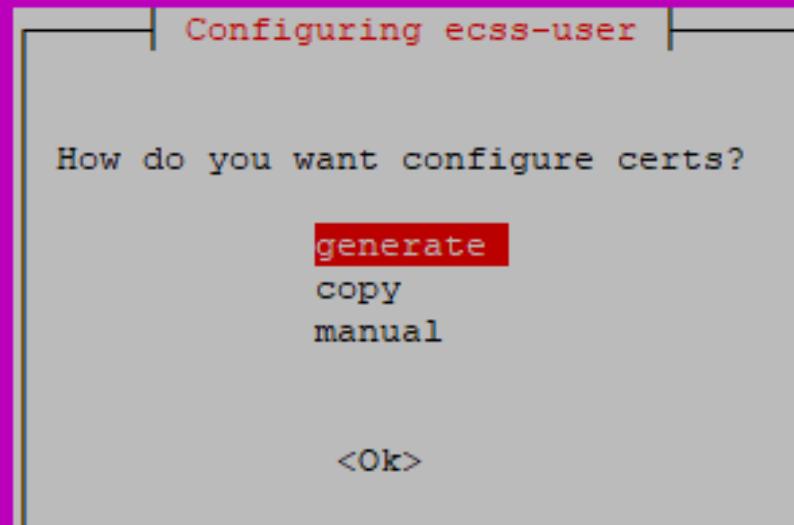

When executing the script, you will be prompted to generate new certificates

If you have no certs created before, choose [generate](#)

# ECSS-10 software installation in «Active-Active» mode

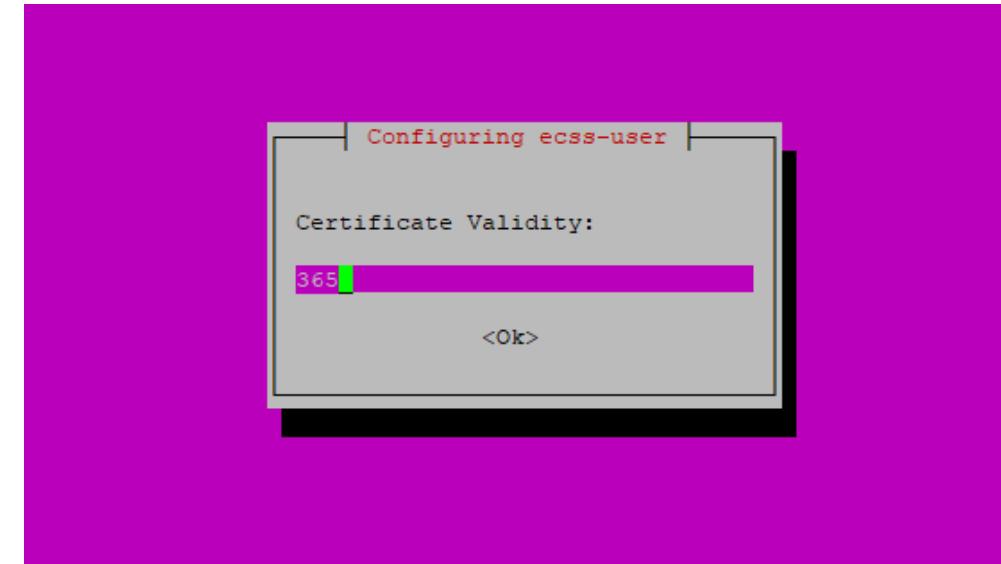

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

**The following questions may be asked during certificate generation:**

- Country (RU)
- State (Novosibirsk)
- City (Novosibirsk)
- Company (ELTEX)
- Department(IMS)
- Cert name(ecss10)
- Mail (ssw-team@eltex.loc)
- Number of days the certificate is valid
- Password for the root private key
- Encryption algorithm for the key
- Key difficulty
- Difficulty for Diffie-Hellman parameters
- Additional names covered by the certificate(eltex office example—ssw1\_eltex.loc, ssw2\_eltex.loc, ssw\_eltex.loc), listed separated by a space (or wildcard)

# ECSS-10 software installation in «Active-Active» mode

Step 2

## Certificates installation on server 2

```
sudo apt install ecss-node
```

Execute to:

When executing the script, you will be prompted to copy the previously created certificates.

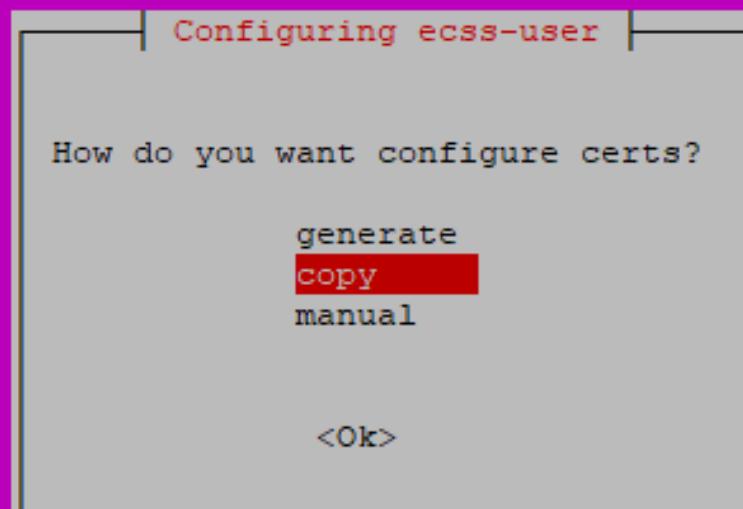

If the certificates were generated successfully, select the option:

copy

# ECSS-10 software installation in «Active-Active» mode

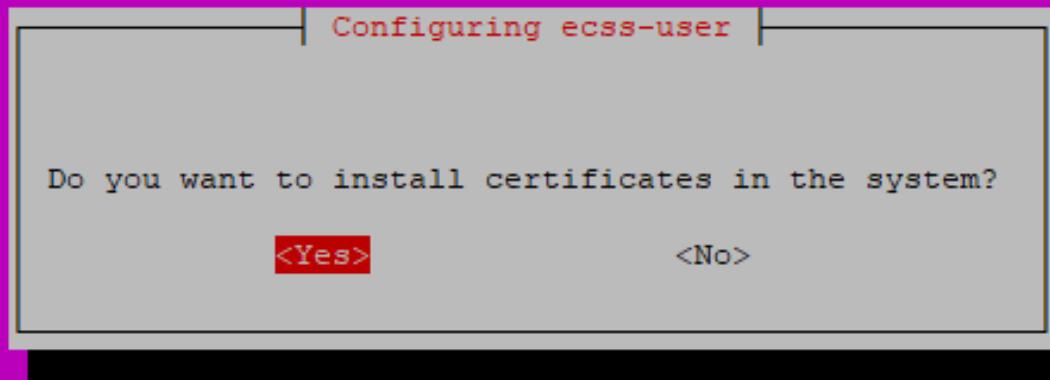

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-user

How do you want to copy certificates by method?

    ssh
    http
    ecss

<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-user
Enter host for connect:
ecssl
<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-user
Enter port for connect:
22<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-user

WARNING!

Before copy copying, make sure that the user from whom
the copying is to be made is a member of the ssw group

<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

## Step 2

```
tester@ecssl:~$ sudo id tester
uid=1000(tester) gid=1000(tester) groups=1000(tester),4(adm),24(cdrom),27(sudo),30(dip),46(plugdev),108(lxd)
tester@ecssl:~$ sudo id -Gn tester
tester adm cdrom sudo dip plugdev lxd
tester@ecssl:~$ 
tester@ecssl:~$ 
tester@ecssl:~$ sudo usermod -a -G ssw tester
tester@ecssl:~$ 
tester@ecssl:~$ 
tester@ecssl:~$ sudo id -Gn tester
tester adm cdrom sudo dip plugdev lxd ssw
tester@ecssl:~$ 
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

## Main components installation

```
sudo apt install ecss-node
```

During the package installation, you will be prompted to setup NTP for time synchronization (for cluster mode)

Execute to:

-  Server 1  
ecss1
-  Server 2  
ecss2

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-node

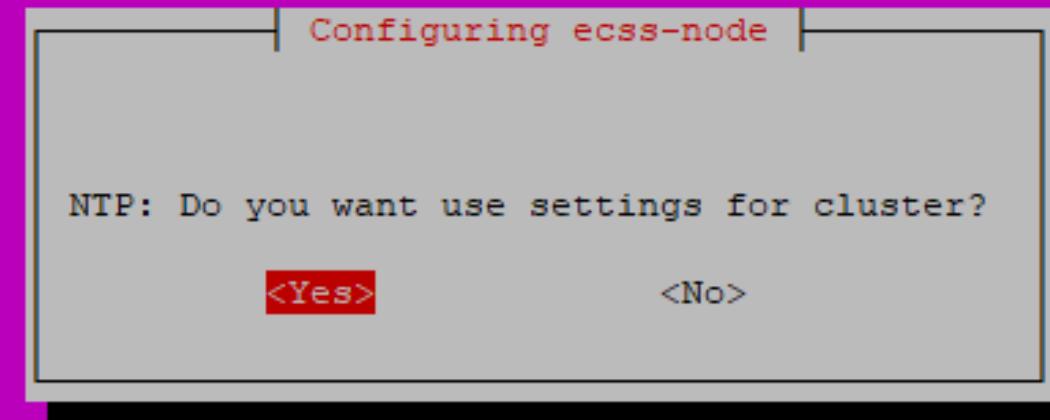

External NTP servers through a space:

0.ru.pool.ntp.org <Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-node

NTP: Set stratum for cluster:
? <Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

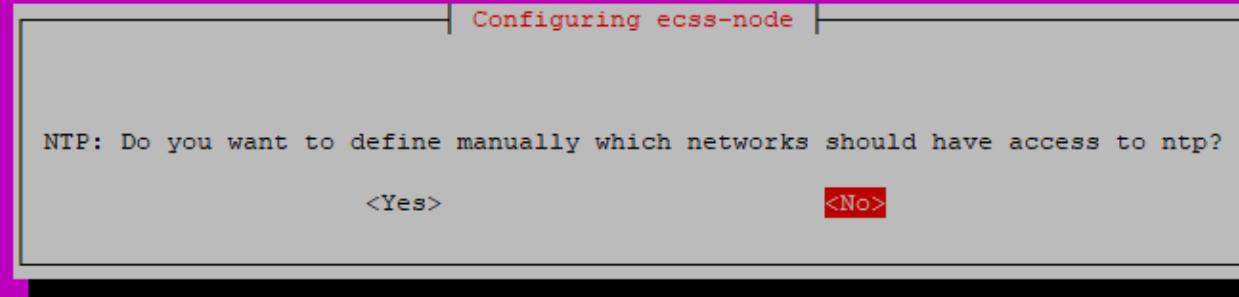

```
Configuring ecss-node

NTP Indicate local servers for synchronization separated a space:
192.168.33.216 <Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

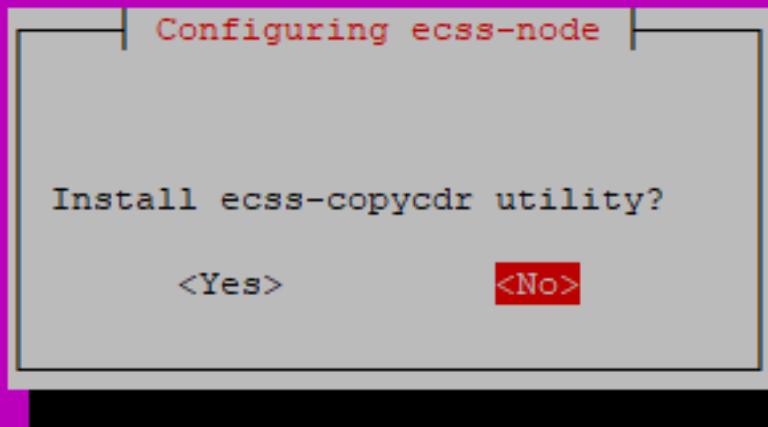

Step 2

```
Configuring ecss-node |  
Format: <ip>|<mask> (x.x.x.x|255.255.255.0)  
  
NTP: Networks, which must have access to the ntp through a space:  
192.168.33.0|255.255.255.0  
  
<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

Step 2

# ECSS-10 software installation in «Active-Active» mode

## Step 2

Configuring wireshark-common

Dumpcap can be installed in a way that allows members of the "wireshark" system group to capture packets. This is recommended over the alternative of running Wireshark/Tshark directly as root, because less of the code will run with elevated privileges.

For more detailed information please see /usr/share/doc/wireshark-common/README.Debian.

Enabling this feature may be a security risk, so it is disabled by default. If in doubt, it is suggested to leave it disabled.

Should non-superusers be able to capture packets?

<Yes>      <No>

# ECSS-10 software installation in «Active-Active» mode

Step 2

```
Configuring ecss-user
Save to a safe place and delete the file /etc/ecss/ssl/ecssl10root.key!
<Ok>
```

# ECSS-10 software installation in «Active-Active» mode

## Step 2

```
* ecss-node: enabling ecss-ds.service
Created symlink /etc/systemd/system/multi-user.target.wants/ecss-ds.service → /lib/systemd/system/ecss-ds.service.
* ecss-node: enabling ecss-core.service
Created symlink /etc/systemd/system/multi-user.target.wants/ecss-core.service → /lib/systemd/system/ecss-core.service.
* ecss-node: enabling ecss-mediator.service
Created symlink /etc/systemd/system/multi-user.target.wants/ecss-mediator.service → /lib/systemd/system/ecss-mediator.service.
* ecss-node: enabling ecss-pa-sip.service
Created symlink /etc/systemd/system/multi-user.target.wants/ecss-pa-sip.service → /lib/systemd/system/ecss-pa-sip.service.
* ecss-node: starting ecss-mycelium.service
* ecss-node: starting ecss-ds.service
* ecss-node: starting ecss-core.service
* ecss-node: starting ecss-mediator.service
* ecss-node: starting ecss-pa-sip.service
* ecss-node: disabling ecss-pa-megaco.service
* ecss-node: mask ecss-pa-megaco.service
Setting up libspandsp2:amd64 (0.0.6+dfsg-0.1) ...
Setting up libwscodecs2:amd64 (2.6.10-1~ubuntul8.04.0) ...

Processing triggers for ufw (0.36-0ubuntu0.18.04.2) ...
tester@ecssl:~$ █
```

# ECSS-10 software installation in «Active-Active» mode

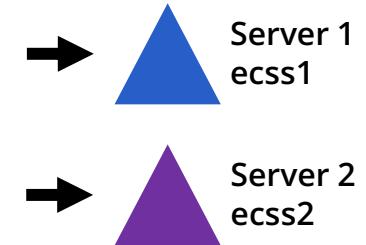

## Step 2

### Main components installation

After completing the installation of the package, in cluster mode you need to configure the cluster name

- `sudo nano /etc/ecss/ecss-mycelium/mycelium1.config`
- `{cluster_name, my_cluster},  
where my_cluster - new cluster name, not «undefined»`

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 2

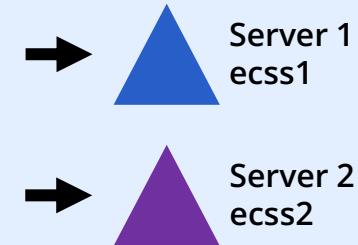

### Main components installation

Also, we have to configure broker file:

- `sudo nano /etc/dnsmasq.d/ecss-broker`
- `address=/primary.broker.ecss/192.168.1.1`
- `address=/secondary.broker.ecss/192.168.1.2`

Where `192.168.1.1` – IP address for server 1, `192.168.1.2` – IP address for server 2. The same settings on server 2.

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

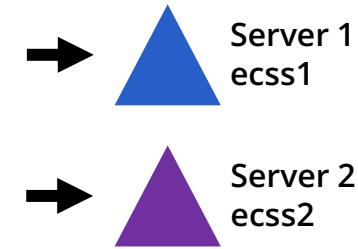

## Step 3

### Glusterfs installation in cluster mode

Install glusterfs-server

- sudo apt install glusterfs-server attr
- sudo systemctl enable glusterd.service
- sudo systemctl start glusterd.service

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 3

**Check the connection(probe) Glusterfs  
in cluster mode**

Execute on ecss1

```
sudo gluster peer probe 192.168.1.2
```

192.168.1.2 – second server address (ecss2)

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 3

**Check the connection(probe) Glusterfs  
in cluster mode**

Execute on ecss2

`sudo gluster peer status`

Collect information about connection:

`ecss1`

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 3

### **Setup new volume in Glusterfs in cluster mode**

Execute on ecss1:

```
sudo gluster volume create ecss_volume replica 2 transport tcp  
192.168.1.1:/var/lib/ecss/glusterfs 192.168.1.2:/var/lib/ecss/glusterfs force
```

192.168.1.1 – primary server address(ecss1), 192.168.1.2 – secondary server address(ecss2).

Start GlusterFS cluster:

```
sudo gluster volume start ecss_volume
```

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 3

### Glusterfs volume settings in cluster

Check the status

```
sudo gluster volume info
```

Volume Name: ecss\_volume

Type: Replicate

Volume ID: 60774e49-d2f1-4b06-bb4a-3f39ccf1ea73

Status: Started

Number of Bricks: 1 x 2 = 2

Transport-type: tcp

Bricks:

Brick1: 192.168.1.1:/restfs

Brick2: 192.168.1.2:/restfs

Execute to:

→  Server 1  
ecss1

# ECSS-10 software installation in «Active-Active» mode

## Step 3

### Mount new volume in OS

Edit this file:

```
sudo nano /etc/systemd/system/ecss-glusterfs-mount.service
```

[Unit]

```
Description=mount glusterfs
After=network.target
Requires=network.target
```

[Service]

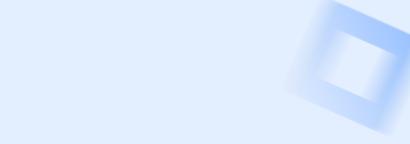

```
RemainAfterExit=no
Type=forking
RestartSec=10s
Restart=always
```

```
ExecStart=/sbin/mount.glusterfs localhost:/ecss_volume /var/lib/ecss/restfs -o fetch-attempts=10
```

```
ExecStop=/bin/umount /var/lib/ecss/restfs
```

[Install]

```
WantedBy=multi-user.target
```

**Execute to:**

→  Server 1  
ecss1

→  Server 2  
ecss2

# ECSS-10 software installation in «Active-Active» mode

Step 3

## Mount new volume in OS

Add new “Unit” in startup

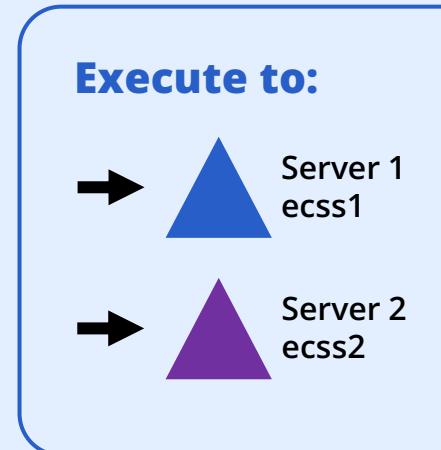

```
sudo nano /etc/systemd/system/ecss-glusterfs-mount.service
```

Then reboot your server/VM

```
sudo reboot
```

And check new volume with command:

```
df -h
```

# ECSS-10 software installation in «Active-Active» mode

## Step 4

### Check the installation and start RestFS

Check this package installation

```
sudo apt install ecss-restfs
```

And start it on both nodes

```
sudo systemctl start ecss-restfs.service
```

**Execute to:**

→  Server 1  
ecss1

→  Server 2  
ecss2

# ECSS-10 software installation in «Active-Active» mode

## Step 5

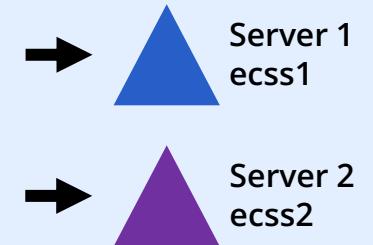

### Install additional system components (optional!)

Install packets

- ecss-web-conf
- ecss-media-server
- ecss-media-resources
- And other ...

Set of services will be change depend on each project installation and requirements.

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

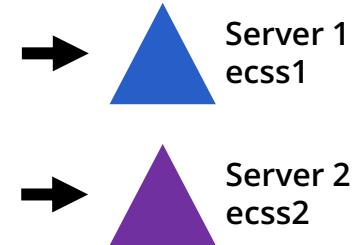

## Step 6

### Setup Epmd service!

Edit epmd settings:

- sudo systemctl edit epmd.service
- [Service]
- Environment="ERL\_EPMD\_ADDRESS=127.0.1.1,192.168.1.1"
- 192.168.1.1 – primary server address (ecss1), 192.168.1.2 – secondary server address (ecss2)

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

## Step 7

### Setup your licensing scheme!

Start services:

- `sudo systemctl start ecss-ds.service`
- `sudo systemctl start ecss-mycelium.service`

Install passport and then add license!

- `/cluster/storage/<CLUSTER>/licence/set-passport <PASSPORT>`
- `/cluster/storage/<CLUSTER>/licence/add [--force | --no-diff] <LICENCE>`

Execute to:

Server 1  
ecss1

# ECSS-10 software installation in «Active-Active» mode

## Step 8

### Check the intallation

Execute node checking command(CoCon):

- ssh admin@<IP\_ECSS> -p8023
- →password
- node/check-services

Execute to:

```
admin@mycelium1@ecss1:/$ node/check-services
```

Nodes:

```
core1@ecss1  core1@ecss2
ds1@ecss1   ds1@ecss2
```

```
md1@ecss1   md1@ecss2
```

```
mycelium1@ecss1 mycelium1@ecss2
sip1@ecss1   sip1@ecss2
```

All services are started

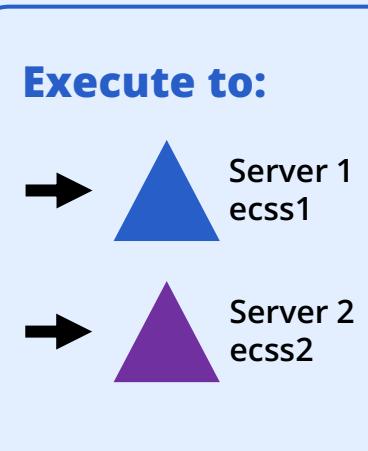

# ECSS-10 software installation in «Active-Active» mode

## Step 8

### Check the installation

Perform a functional test:

- Web-configurator
- CoCon console
- Domains, aliases, trunks, bridges
- Protocol adapters
- Media-servers (MSR)
- Restfs volumes
- Configuration replication and backup
- Cluster state, alarms

# ECSS-10 software installation in «Active-Active» mode

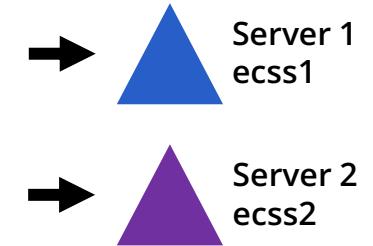

Replication settings based on Keepalived and VRRP

## Setup keepalived service

During the process of installation, you will need:

- Access to the keepalived configuration files
- Free virtual IP addresses for replication:
  - SIP1 vIP – 192.168.1.3
  - SIP2 vIP – 192.168.1.4
  - MySQL vIP – 192.168.1.5
- VRRP virtual\_router\_id for SIP1 – 50
- VRRP virtual\_router\_id for SIP2 – 51
- VRRP virtual\_router\_id for MySQL – 49

**Execute to:**

# ECSS-10 software installation in «Active-Active» mode

Replication settings based on Keepalived and VRRP

## ecss1 configuration example

```
vrrp_script check_sip {  
script "/usr/bin/ecss_pa_sip_port 65535"  
interval 2  
timeout 2 }
```

```
vrrp_instance SIP_1 {  
state MASTER  
interface ens160  
garp_master_delay 10  
smtp_alert  
virtual_router_id 50  
priority 100  
advert_int 1  
authentication { auth_type PASS auth_pass 1111 }  
virtual_ipaddress { 192.168.1.3 label ens160:sip1 }  
track_script { check_sip }  
}
```

Execute to:

# ECSS-10 software installation in «Active-Active» mode

Replication settings based on Keepalived and VRRP

## ecss1 configuration example

```
vrrp_instance SIP_2 {  
    state BACKUP  
    interface ens160  
    virtual_router_id 51  
    priority 50  
    advert_int 1  
    authentication { auth_type PASS      auth_pass 1111 }  
    virtual_ipaddress { 192.168.1.4 label ens160:sip2 }  
    track_script { check_sip }  
}  
  
include mysql.conf
```

Execute to:

# ECSS-10 software installation in «Active-Active» mode

Replication settings based on Keepalived and VRRP

## ecss1 configuration example

```
vrrp_script check_mysql {  
script "/usr/bin/mysql --defaults-file=/etc/mysql/debian.cnf -e 'SELECT 1;'"  
user root  
interval 2  
fall 1  
timeout 2  
}  
  
vrrp_instance MySQL {  
state MASTER # Initial state at start  
interface ens160 # The name of the network interface on which the VRRP protocol will run  
virtual_router_id 49 # Unique router identifier (0..255)  
priority 100 # Priority (0..255) the higher – more priority  
advert_int 1 # Notification interval (s)  
preempt_delay 60 # Waiting interval for the master when starting the daemon (s) in the initial state BACKUP  
BACKUP virtual_ipaddress { 192.168.1.5 label ens160:mysql }  
track_script { check_mysql }  
}
```

Execute to:

# ECSS-10 software installation in «Active-Active» mode

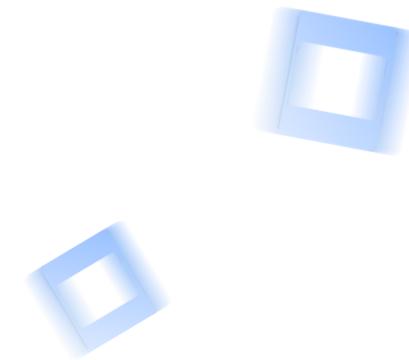

Replication settings based on Keepalived and VRRP

## ecss2 configuration example

```
vrrp_script check_sip {  
script "/usr/bin/ecss_pa_sip_port 65535"  
interval 2  
timeout 2 }
```

```
vrrp_instance SIP_1 {  
state BACKUP  
interface ens160  
garp_master_delay 10  
smtp_alert  
virtual_router_id 50  
priority 50  
advert_int 1  
authentication { auth_type PASS auth_pass 1111 }  
virtual_ipaddress { 192.168.1.3 label ens160:sip2 }  
track_script { check_sip }  
}
```

Execute to:

# ECSS-10 software installation in «Active-Active» mode

Replication settings based on Keepalived and VRRP

## ecss2 configuration example

```
vrrp_instance SIP_2 {  
state MASTER  
interface ens160  
virtual_router_id 51  
priority 100  
advert_int 1  
authentication { auth_type PASS auth_pass 1111}  
virtual_ipaddress { 192.168.1.4 label ens160:sip1 }  
track_script { check_sip }  
}
```

include mysql.conf

Execute to:

# ECSS-10 software installation in «Active-Active» mode

Replication settings based on Keepalived and VRRP

## ecss2 configuration example

```
vrrp_script check_mysql {  
script "/usr/bin/mysql --defaults-file=/etc/mysql/debian.cnf -e 'SELECT 1;'"  
user root  
interval 2  
fall 1  
timeout 2  
}  
  
vrrp_instance MySQL {  
state BACKUP # Initial state at start  
interface ens160 # The name of the network interface on which the VRRP protocol will run  
virtual_router_id 49 # Unique router identifier (0..255)  
priority 50 # Priority (0..255) the higher – more priority  
advert_int 1 # Notification interval (s)  
preempt_delay 60 # Waiting interval for the master when starting the daemon (s) in the initial state BACKUP  
virtual_ipaddress { 192.168.1.5 label ens160:mysql }  
track_script { check_mysql }  
}
```

Execute to:
